Coding meeting (shared screens on Google Hangouts, all members attended)

- Implement consensus algorithm methods in set up and network files

http://www.marinamele.com/2014/03/13-useful-tips-about-python-datetime.html

Constant code running to select forgers:
So if we want plus_one - start_of_day = 0 to 59 seconds inclusive
If we exchange start_of_day with datetime.datetime.now(), we have

Now = datetime.datetime.now()
Plus_one - (Now.hour, Now.minute, Now.second)

 and
If that is between 0 and 59 seconds, then the time is between 8:00 and 8:01 I think, but maybe the year will be a problem

Multiple forgers, primary forger, alternate forgers?

The blocks could be signified by the transaction fees being given to the forger for validating their set of transactions

Goals:
Transaction validation
Command prompt
